1 INTRODUCTION

The Sudbury to Hudson Reliability Project (Project) consists of a new, approximately 9-mile-long transmission line between Eversource's existing Sudbury substation in Sudbury, Massachusetts, and the Hudson Light & Power Company's (HL&P) substation in Hudson, Massachusetts. The new underground transmission line will be installed in the municipalities of Sudbury, Hudson, Stow, and Marlborough, Massachusetts. Approximately 7.5 miles of the new transmission line will be installed within an inactive Massachusetts Bay Transportation Authority (MBTA) railroad right-of-way (ROW) which is to be converted into the Massachusetts Central Rail Trail (MCRT).

Special Condition Part I(q) of the Sudbury Order of Conditions (OOC) for the Project required baseline and construction phase monitoring of flow and water quality for all Coldwater Fisheries Resources (CFR) crossed by the Project. SWCA has prepared this quarterly summary of the water quality monitoring for the two (2) crossings of CFR in Hop Brook and six (6) other streams or tributaries that contribute to CFR and are crossed by the Project (see Figures in Appendix A).

The following eight streams were included in this monitoring plan as requested by the Sudbury Conservation Commission:

- Hop Brook – Bridge 128 (400+30): ST 400 Perennial Stream and State-listed CFR;
- Unnamed Stream (527+30): ST 527 Intermittent Stream and local CFR;
- Dudley Brook (539+40): ST 540 Perennial and local CFR;
- Unnamed intermittent stream (560+82): ST 561 Intermittent and local CFR;
- Unnamed Intermittent stream (593+18): ST 593 Intermittent and local CFR;
- Intermittent Tributary to Hop Brook (700+50, 710+50): ST 700/710 Intermittent and local CFR;
- Hop Brook (Bridge 127) (725+00): ST 725 Perennial Stream and State-listed CFR; and
- Intermittent Tributary to Wash Brook (747+39): ST 747 Intermittent and local CFR.

2 WATER QUALITY MONITORING METHODS AND RESULTS

2.1 Surface Water Monitoring Methods

In accordance with the *Baseflow and Baseline Water Quality Monitoring Program for Cold Water Fisheries* proposed by SWCA dated August 25, 2021 and approved by the Sudbury Conservation Commission, the following parameters were monitored on a monthly basis:

- temperature, dissolved oxygen, as well as pH, specific conductivity, and oxygen reduction potential (ORP) measured with a YSI multi-meter;
- flow velocity with a Hach FH950 flow velocity meter;
- turbidity levels measured with a turbidity meter; and

- chlorine, hardness and alkalinity measured with field test strips.

Based on the Massachusetts Surface Water Quality Standards (SWQS) (314 CMR 4.00), CFRs have special designated criteria for dissolved oxygen and temperature. All other criteria are the same as those for warm water fisheries.

The following Table 1 includes ranges for temperature, dissolved oxygen and pH that are favorable to cold water fisheries. Table 2 indicates ranges for other surface water criteria that are favorable for freshwater fish.

Table 1. Surface Water Conditions for Cold Water Fisheries

Parameter ¹	Favorable Ranges for Cold Water Fisheries
Temperature	below 20°C (up to 26°C for 24 hours)
Dissolved Oxygen	min of 6 mg/L, up to 7 mg/L preferred
pH	6.5 - 8.3

Note: C = Celsius; mg/L = milligrams per liter

Source:

1: 314 CMR 4.00: Massachusetts Surface Water Quality Standards

Table 2. Surface Water Conditions for Freshwater Fish

Parameter	Favorable Ranges for Freshwater Stream or Fish
Specific Conductivity ¹	150 - 500 µS/cm
Turbidity ²	"free from turbidity that would impair fish habitat"
Chlorine ³	<4 mg/L
Alkalinity ^{4,5}	< 300 mg/L

Note: ORP = oxygen reduction potential; mg/L = milligrams per liter; µS/cm = microsiemens per centimeter; mV = millivolts

5: EPA National Recommended Water Quality Criteria for Aquatic Life.

During this quarterly monitoring period (November 2023 to January 2024) SWCA monitored these eight locations on November 30, December 28, and January 23, 2024. Earth disturbance activities began near the monitoring points beginning in January 2023 and have continued through this quarterly monitoring period. All crossings were observed to be flowing to some extent during at least one of those monitoring events with the exception of the unnamed stream at station 593+18, which has never been observed to be flowing since the initial survey was conducted. Temperature and dissolved oxygen can change naturally when the sun rises and enables aquatic plants to release more oxygen. Sampling was conducted in the same order of monitoring points and as a result, the sampling was conducted during roughly the same time of day at each location each month to help ensure comparability over time. Table 3 attached to this report in Appendix B summarizes the data collected during each of these monitoring events. The individual summary field logs are also included in Appendix C.

2.2 Temperature

Temperature of the surface water correlated to the temperature of ambient air from the week leading up to each monitoring event at all stations. Generally, surface water temperatures decreased during the November monitoring event, increased in the December monitoring event and then decreased in the January monitoring event relative to the ambient air temperatures from the week up to each monitoring event. Surface water temperatures in November ranged from 1.1 to 5.8 degrees Celsius. Temperatures rose to ranges of 3.4 to 8.1 degrees Celsius in December due to unseasonably warm ambient air temperatures prior to this sampling event. In January, the stream temperatures ranged from 0.2 to 6.2 degrees Celsius. The upgradient and downgradient temperature readings across the Project are similar and comparable to each other, and therefore the construction activities have not impacted surface water temperatures.

2.3 Dissolved Oxygen

Dissolved oxygen levels were varied in all locations for all three months, with results being both above and below the favorable value of 6 mg/L. Stations 527 U, 561 U/D, and 700 U were < 6 mg/L in the month of November. Stations 700 U was also <6 mg/L in December and January. The upgradient and downgradient dissolved oxygen readings across the Project are similar in comparison to each other, and therefore the construction activities have not impacted surface water dissolved oxygen levels.

2.4 pH

The monitoring locations reported most of the pH levels to be within normal ranges for cold water fisheries at 6.5-8.3 for November 2023 through January 2024. Only station 527 U/D was below the normal range pH levels. Additionally, in November, the only other station with pH reading below the normal range was ST 747 D. All other stations were within the normal ranges for cold water fisheries at pH 6.5-8.3. The upgradient and downgradient pH readings across the Project are similar to each other, and therefore the construction activities have not impacted surface water pH levels.

2.5 Specific Conductivity

At a majority of the stations for all three monitoring events, the specific conductivity (at 25 degrees Celsius) readings were within the acceptable range for freshwater fisheries at 150-500 µS/cm. Readings were outside the acceptable range at 400 U/D (November and January), 561 U (December), 561 D (December and January), 700 U (November through January), 710 D (November), and 747 U (November). Stations 700 U and 710 D were at significantly higher than the acceptable range, with readings above 1000 µS/cm for November and December. However, these results correlate with previous monitoring results at this station. Further, no difference was observed between the upgradient and downgradient readings across the Project, and therefore the construction activities have not impacted surface water specific conductivity.

2.6 Turbidity

Turbidity levels are not specifically defined by a standard value in Massachusetts. Based on available information, for the purpose of this assessment, it can be assumed that a value of less than 5 Nephelometric Turbidity Units (NTU) is favorable for freshwater, however a lower NTU is considered more favorable as typical groundwater is less than 1 NTU. For each of the monitoring events between November 2023 through January 2024, turbidity levels at each station were observed to be less than 5 NTUs in all locations other than Stations 747 U (November and December), 747 D (December), 700 U

and 710 D (all three months) at the Hop Brook Tributary. Within this Hop Brook Tributary, poor water quality conditions and frequent turbid water has been observed including before construction began. The upgradient and downgradient readings across the Project coincide to each other, concluding the construction activities have not impacted surface waters turbidity.

2.7 Other Parameters

The stream flow velocities from the downgradient side to the upgradient side were similar and consistent from month to month. The ORP, alkalinity, chlorine, and hardness levels from the downgradient side to the upgradient side were the same within the sampling months. Alkalinity and chlorine levels were within the desirable levels for freshwater.

3 SUMMARY

No significant differences were observed between upgradient and downgradient stations across the Project corridor. Therefore, construction activities do not appear to be impacting the water quality of these coldwater fisheries.
